

PASSENGER CAR TRACK LIST 1970 AND LATER VEHICLES

Section LS on Tyres, Rims, Suspension and Steering of the Vehicle Standards Bulletin 14 on the National Code of Practice (NPC) for Light Vehicle Construction and Modifications states that the wheel track of passenger cars must not be increased by more than 25mm beyond the maximum specified by the vehicle manufacturer for the particular model. This means that the rim offset must not be changed by more than 12.5mm.

The vehicle details in this Fact Sheet specify the maximum allowable wheel track for each vehicle including the 25mm tolerance (plus 1 mm). All Vehicles will fail for wheel track measurement if it meets or exceeds the specified measurement.

DETERMINATION OF WHEEL TRACK

Wheel track is the distance measured across an axle from the centre line of one tyre tread to the centre line of the opposite tyre tread.

The fitting of wheels to a vehicle with a different offset will alter the wheel track. An increase in wheel track, will result in additional load on the wheel bearings, axles, steering and suspension components, as well as changing the steering geometry of the vehicle. This could seriously affect the safety of the vehicle.

RIM OFFSET

Offset is the distance between the rim mounting face and the centre line of the rim. This distance is termed positive when the mounting face is outboard of the rim centre line. i.e. original equipment rims. When the mounting face is inboard of the rim centre line, this is termed a negative offset i.e. deep-dish rims.

A DECREASE IN RIM OFFSET (i.e. negative) WILL RESULT IN A INCREASE IN WHEEL TRACK

A DECREASE IN RIM OFFSET (i.e. negative)

WILL RESULT IN A INCREASE IN WHEEL TRACK

STEERING WHEELS

All passenger cars and passenger car derivatives manufactured on or after the 1st January 1971 are required to comply with Australian Design Rule 10 - Steering Columns. Vehicles that are required to comply with ADR 10 may be fitted with the standard steering wheel, a manufacturer's optional steering wheel for that particular make and model or an approved aftermarket wheel.

Acceptable aftermarket steering wheels are;

- Momo
- Isotta

The diameter of the steering wheel is measured from the outside of the rim on one side across to the corresponding point on the opposite side of the rim. In the case of a non-circular wheel the measurement is taken at the widest point. Steering wheels with an outside diameter of less than 330mm are **not** permitted.

For further information regarding the acceptability of an aftermarket steering wheel please contact Vehicle Standards on 1300 882 248.

MAXIMUM TOWING WEIGHT

This list includes the maximum braked and unbraked weight that can be towed by that vehicle, according to the vehicle manufactures specifications. This includes the weight of the trailer, or vehicle, being towed and any load being carried in it.

It should be noted that some manufacturers stipulate speed restrictions and towing equipment or towing packs required for the vehicle to be able allow the maximum weight specified. This information is generally available in the Owners Manual or available from the vehicle manufacturer.

When Aftermarket wheels are fitted to passenger cars, or their derivatives, manufactured on or after the 1st July 1985, the rims must be marked with the following information;

1. Rim offset. e.g. 10P = 10mm Positive.
2. Rim dimensions. e.g. 7JJ X 14 = 7 inch width, 14-inch diameter.
3. Name of rim manufacturer and the standard to which it was manufactured.

SUSPENSION CLEARANCE

Under the NCP the available suspension travel of a vehicle must **not** be reduced by more than one third. The specifications included in this list are the minimum allowable.

DETERMINATION OF BUMP RUBBER CLEARANCE

The suspension bump clearance is the distance between the bump rubber, which is usually mounted on the lower control arm or above the upper control arm, and the corresponding contact point. The clearance must be measured with the vehicle on level ground, in its normal operating but unladen state.

DETERMINATION OF VEHICLE EYEBROW HEIGHT

Vehicle bump clearance specifications as designated with the symbol (E) signifies the vehicles minimum eyebrow height. This distance is measured from the centre of the wheel vertically upward to the edge of the vehicles mudguard, with the vehicle in its normal operating but unladen condition.
